2. Applied Element Method

21 to 22 Sept 2009

- Beginning 1996, Professors Hatem TAGEL-DIN and Kimiro MEGURO have developed a new method for structure modeling.
- **AEM** combines features from finite element and discrete element methods.

- There is a single type of element - cuboids

finite element methods

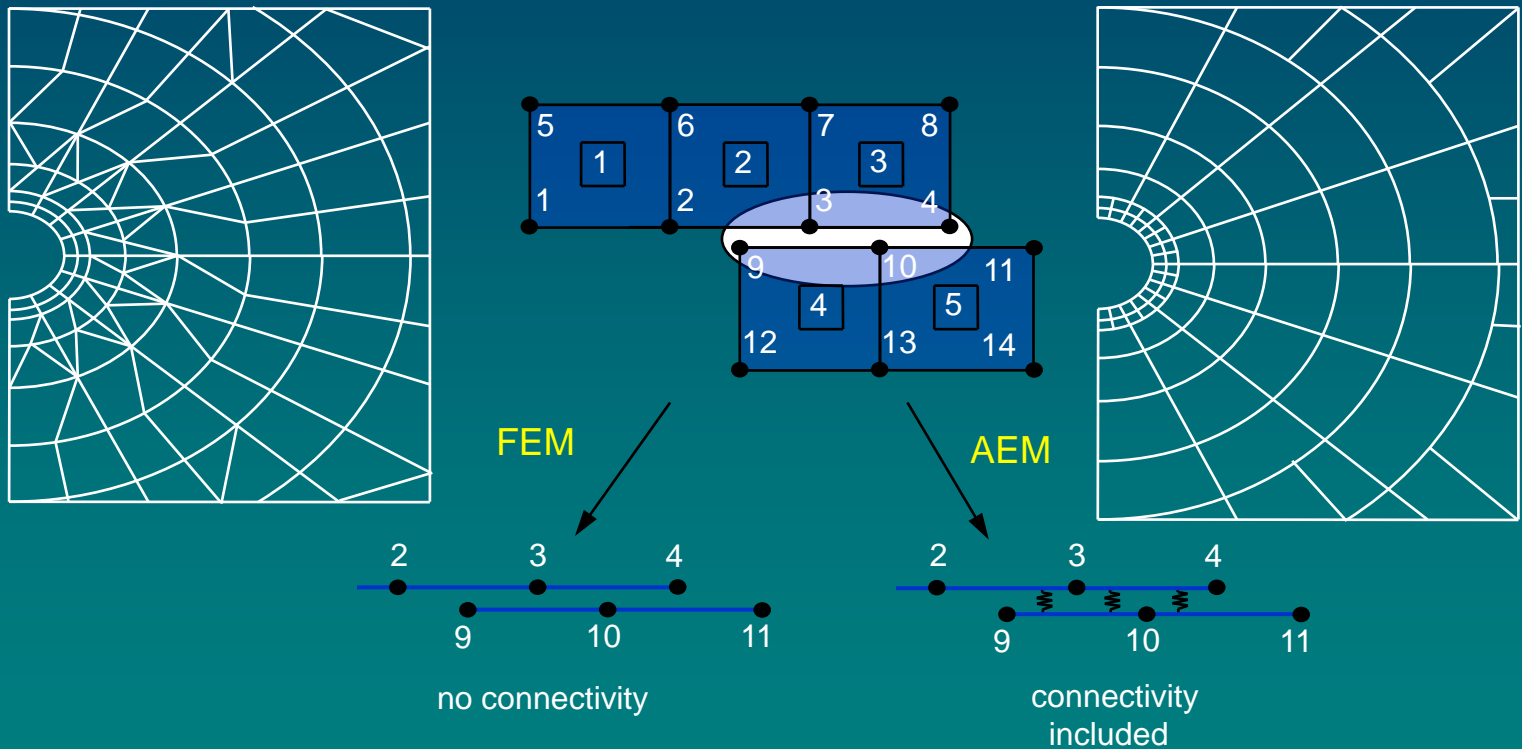

- Two elements are connected through a series of contact points. In every point are attached three springs.

2. Applied Element Method

21 to 22 Sept 2009

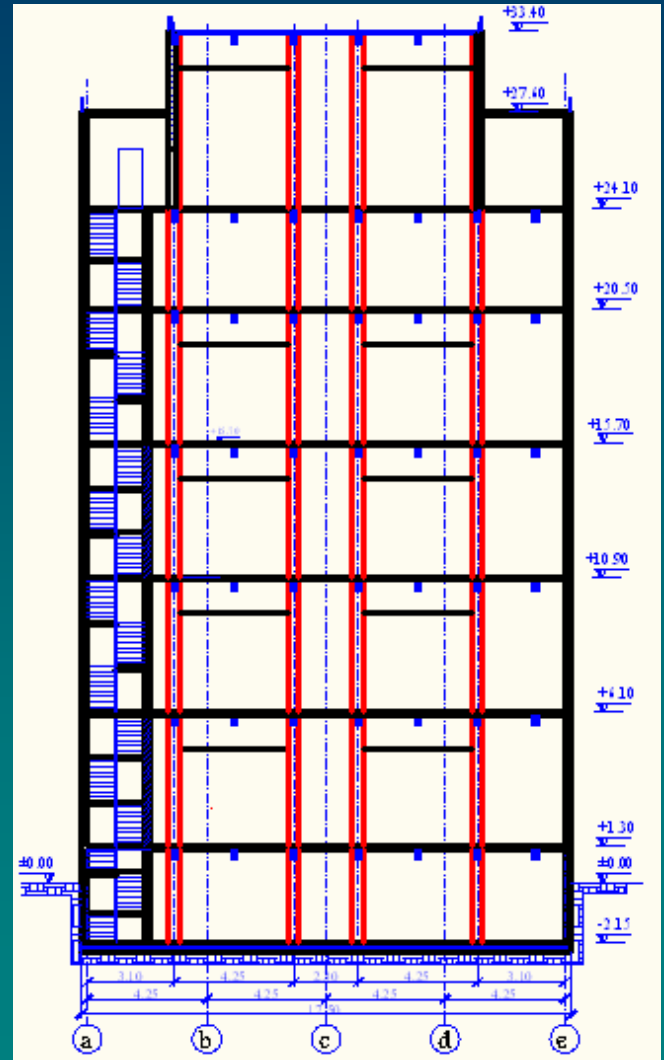

- There is no need for transition elements, it is allowed the partial element connectivity and the springs are generated at interface of elements.

- The using of this modeling method allowed that the initiation and propagation of cracks and the failure of the structure can be studied using only one initial model.

3. Case study – the building

21 to 22 Sept 2009

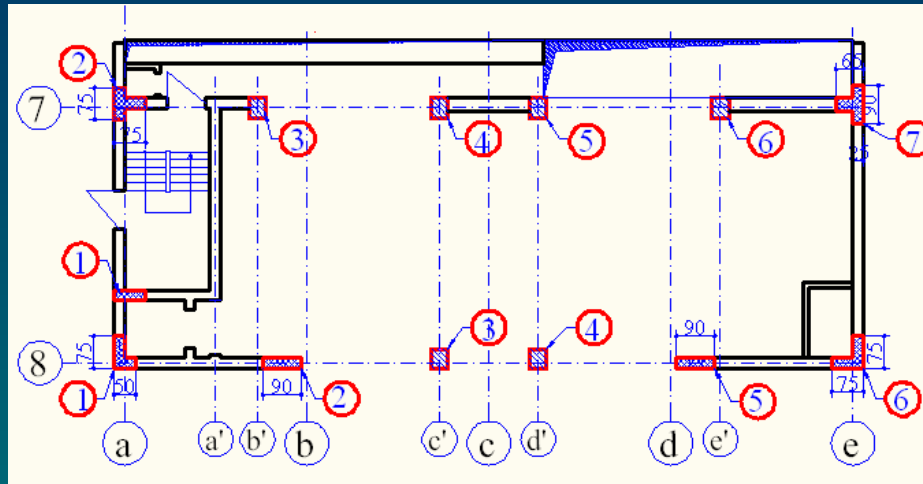

3. Case study – preparatory works

21 to 22 Sept 2009

3. Case study – explosion steps

21 to 22 Sept 2009

Plan of the explosion steps

Explosion steps in axis 8

Explosion steps in axis 7

3. Case study – geometrical modelling

21 to 22 Sept 2009

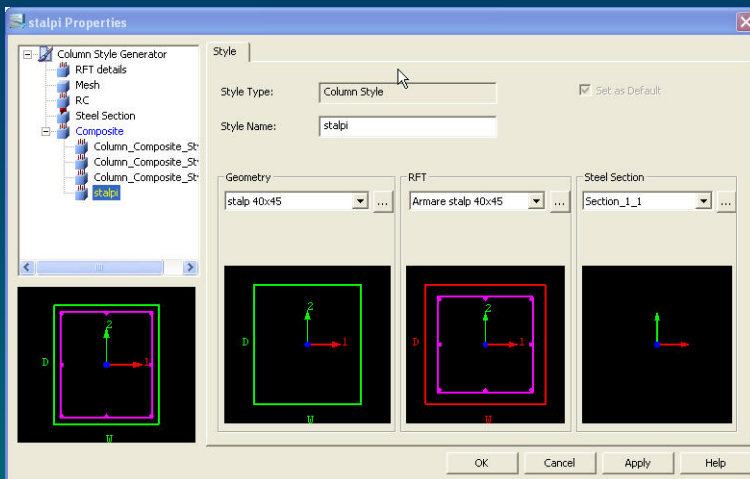

Geometrical model

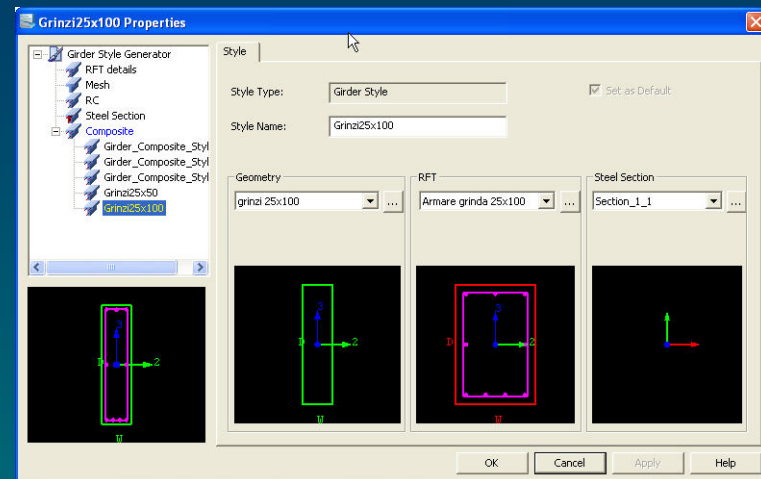

Geometrical model with
“preparatory works”

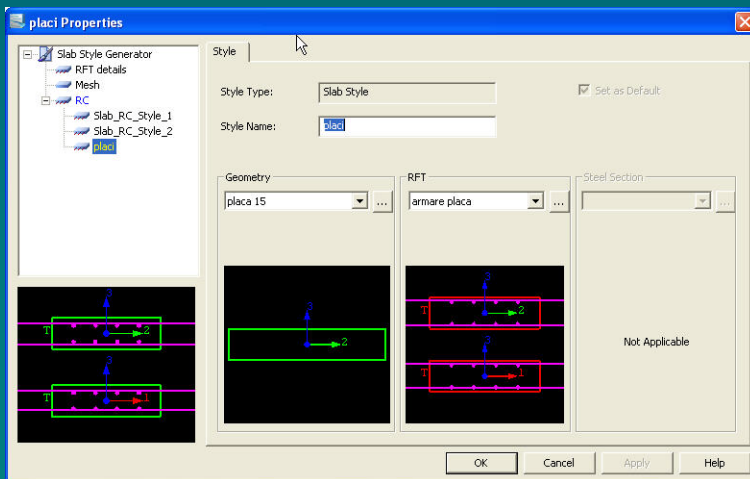

3. Case study - geometrical modelling

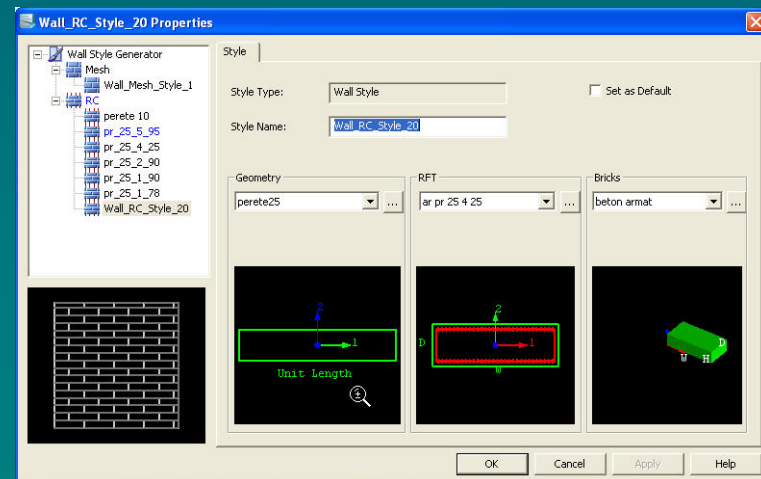

Modelling of Columns

Modelling of Girders

Modelling of slabs

Modelling of walls

21 to 22 Sept 2009

- Step 1
- Step 2
- Step 3
- Step 4
- Step 5
- Step 6
- Step 7

3. Case study - results

Displacements corresponding to points indicated in left part

Points where were determined displacements and vertical forces were

Variation of vertical force corresponding to point 1

4. Conclusions

- *Applied Element Method” combines features of Finite Element Method and Discrete Element Method, having as main advantage the possibility to describe the behavior of structure beginning with loadings application, initiation and propagation of cracks, elements separation until total collapse of the structure.*
- *It can be seen that points where occurs accentuated changing in downgrade corresponds to moment of explosions and thus to the moment of support elements destruction.*
- *It is shown that the joints above one of the removed columns in two different floors moved almost identically, with the floor above having slightly smaller displacement.*
- *The results show a good correlation between numerical simulation and real demolition of the structure.*
